1 the way to think the problem

When I see the numbers,i guess it is the order you press the mobile phone buttons.

But there are many Typewritings.The first thing I do was to use 26 English input method.

I got the result eetewqrqreurreyquqteew.But this answer is wrong.During the process,

I find divided the numbers into two groups,the result are 33 53 21 41 43 74 74 43 61 71 53 32.

We can see that the second number is no more than 4.SO I guess the input method is 9 keys.The first number was the location of button,the second number is the order of letter.SO the final result is flagissimple.It is right.
